A summary of Groups and Rings SF2729

JIM HOLMSTRÖM

Abstract

This paper contains a brief summary of the course Groups and Rings which is given at KTH in Stockholm. The basis for this is the book: A First Course In Abstract Algebra by John B. Fraleigh.

Contents

1	Definitions	1
1.1	Structures	1

Chapter 1

Definitions

1.1 Structures

1.1.1 Set

1.1.2 Binary algebraic structure

Denoted by $\langle \mathcal{S}, * \rangle$ is a set \mathcal{S} with a binary operator $*$ on \mathcal{S} .

Identity element

An element e is an identity element in the structure $\langle \mathcal{S}, * \rangle$

$$e * x = x * e = x \quad \forall x \in \mathcal{S} \quad (1.1)$$

Theorem 1. *The identity element e is unique in the binary structure ... p32*

Proof. p32 □

Theorem 2. *If $\phi : \mathcal{S} \rightarrow \mathcal{S}'$ is an isomorphism of $\langle \mathcal{S}, * \rangle$ with $\langle \mathcal{S}', *' \rangle$ then $\phi(e)$ will be the identity in $\langle \mathcal{S}', *' \rangle$.*

Proof. Need to show

$$\phi(e) *' x' = x' *' \phi(e) = x' \quad \forall x' \in \mathcal{S}' \quad (1.2)$$

ϕ is onto(3.1.2).

$$e * x = x * e = x \Rightarrow \phi(e * x) = \phi(x * e) = \phi(x) \quad (1.3)$$

We chose $x : \phi(x) = x'$ using the homomorphism property we can rewrite it to

$$\phi(e) *' \phi(x) = \phi(x) *' \phi(e) = \phi(x) \quad (1.4)$$

□

1.1.3 Group

A group is a binary algebraic structure (1.1.2) with the following properties:

G1

G2 ...

1.1.4 Ring

1.1.5 Field

1.2 Substructures

1.2.1 Subgroup

1.2.2 Subring

1.2.3 Ideal

1.3 Relations between structures

1.3.1 Homomorphism

A map that preserves the algebraic structure between $\langle \mathcal{S}, * \rangle, \langle \mathcal{S}', *' \rangle$ by satisfying:

$$\phi(x * y) = \phi(x) *' \phi(y) \quad \forall x, y \in \mathcal{S} \quad (1.5)$$

1.3.2 Isomorphism

A isomorphism is a homomorphism (1.3.1) with the additional property of ϕ being a one-to-one map between \mathcal{S} and \mathcal{S}' .

$\exists \phi$ isomorphism between $\langle \mathcal{S}, * \rangle, \langle \mathcal{S}', *' \rangle$ we say that those are isomorphic. Isomorphic is denoted by $\mathcal{S} \cong \mathcal{S}'$ omitting the $\langle \cdot, * \rangle$ since it almost always clear which operator is considered.

Showing that binary structures are isomorphic

Step 1 Define ϕ , that is describe $\phi(a) \forall a \in \mathcal{S}$

Step 2 Show that ϕ is one-to-one. (3.1.1)

Step 3 Show that ϕ is onto. (3.1.2)

Step 4 Show that ϕ is a homomorphism. (1.3.1)

1.3.3 Group action

1.4 Bijective functions

1.4.1 Permutation

Chapter 2

Useful theorems

2.1 LOREM IPSUM

2.1.1 Lagrange's Theorem

2.1.2 Cauchy's Theorem

Chapter 3

Misc. Later put into some of the above chapters

3.0.3 Equivalence relation \mathfrak{R}

\mathfrak{R} is an equivalence relation on a set \mathcal{S}
 \Leftrightarrow

$$\begin{cases} x\mathfrak{R}x \\ x\mathfrak{R}y \Rightarrow y\mathfrak{R}x \\ x\mathfrak{R}y \wedge y\mathfrak{R}z \Rightarrow x\mathfrak{R}z \end{cases}, \forall x, y, z \in \mathcal{S} \quad (3.1)$$

The equivalence relation is often denoted with a \sim

3.0.4 Binary operations $*$

$$\begin{aligned} * : \mathcal{S} \times \mathcal{S} &\rightarrow \mathcal{S} \\ (x, y) &\mapsto *((x, y)) = x * y \end{aligned} \quad (3.2)$$

The binary function $*((x, y))$ is denoted by $x * y$.

\mathcal{H} closed under $*$

$\mathcal{H} \subseteq \mathcal{S}$ closed under $*$:

$$a, b \in \mathcal{H} \Rightarrow (a * b) \in \mathcal{H} \quad (3.3)$$

Note that in the case $\mathcal{H} = \mathcal{S}$ will always be closed from the definition of the operation.

Commutative

Commutativity is the operation property:

$$a * b = b * a \quad \forall a, b \in \mathcal{S} \quad (3.4)$$

Associative

Associativity is the operation property:

$$(a * b) * c = a * (b * c) \quad \forall a, b, c \in \mathcal{S} \quad (3.5)$$

which basically means that the order of operation is invariant and we might as well denote both expressions in (3.5) unambiguously without specifying the operation order with $a * b * c$.

3.1 these are grouped somehow

3.1.1 One-to-one

A one-to-one map ϕ means that each element x has a corresponding $\phi(x)$.

Show one-to-one by showing:

$$\phi(x) = \phi(y) \in \mathcal{S}' \Rightarrow x = y \in \mathcal{S} \quad (3.6)$$

That is given the first statement in (3.6) deduce the next statement.

3.1.2 Onto

ϕ is onto \mathcal{S}' if ... Show onto by showing:

$$\forall x' \exists x : \phi(x) = x' \quad x \in \mathcal{S}, x' \in \mathcal{S}' \quad (3.7)$$

That is assume x' is given show that $\exists \dots$
